

Fast-fit wiring system cuts luminaire installation time

A fast-fit luminaire wiring system from Cooper Lighting offers a simple way of speeding up the installation process as well as facilitating maintenance and any future reconfiguration of a lighting scheme.

Known as the Connect Wiring System, this time-saving innovation uses GST 4-pole self-locking connectors, which have a maximum current rating of 16A and can be plugged in or unplugged under load. The system is

compatible with any of Cooper's Crompton Lighting range of modular recessed fluorescent fittings. Luminaires are simply linked together using a Connect Wiring System prefabricated lead kit, which consists of a T-connector and a 3m or 5m length of 4-core LS0H (low smoke zero halogen) cable, fitted with a plug at each end.

Suitable for use with both standard mains and emergency converted luminaires, the Connect Wiring System is ideal for any project where minimising installation time is a key consideration.
